## **1. Introduction:**

### **Mininet**

In a software-defined network, Mininet is one of the most widely used tools based on this network technology. This device acts as an emulator which can be used like that an emulator. One can use this to visualize various switches which is one of the foremost functions of a software-defined network. This tool is used worldwide to make various performances for different experiments one must perform (Hong *et al.*, 2020). This is done to give a better understanding of the learning tool that is used to test furthermore helping the user to learn more about software-defined networks. Mininet helps the user to get a faster and more customized technological service that helps them to maintain the OpenFlow switches. Hence this service tool has won the preference of most the users when compared to other services available. It installs a virtual machine along with a virtual box that can perform all the functions required to be performed. With Mininet, the internal network functions are handled with ease.

### **ONOS**

ONOS stands for open network operating system. This is identified as one of the most efficient open Source SDN controllers that have become a necessity to build the next generation SDV/NFV solutions making it the leading open source worldwide. It has been designed in a way to meet the needs of operators that aim at building carrier-grade solutions. ONOS can eliminate the requirement of running routing and switching control protocols which in turn saves a lot of time for the user. This can be done as ONOS can support both configuration and real-time control of the given network (Monika *et al.*, 2020). It has been concluded that in ONOS cloud controller,

the movement and innovation have become a subject of networking operation for the end users facility. ONOS is one of the most reliable sources when it comes to the operation of such subjects.

### **Mininet-wifi**

When it comes to managing various network functions, Mininet-wifi can be considered to be the most efficient network in a mininet SDN network emulator. Mininet-wifi is relied upon widely when it comes to visualizing switches and application of software-defined networks. Here, the OpenFlow protocols present within the wifi is used as a network device that is self-defined thus maintaining the flow of operation. With the help of a Hybrid Physical Virtual and software Defined wireless networking strategy, the user can develop a wireless driver improving the operations of a wifi station management.

## **2. Practical Coursework**

### **a. Task1:**

#### **i. Methodology**

### **Task: 1**

1.

Name	MAC	IP Address	(X, Y) coordinates	SSID	Password	Model	Range	Channel
AP1	00:00:10:10:20:10	N/A	(60,60,0)	ap1	21079100	DI524	30	1

AP2	00:00:10:10:20:11	N/A	(120,60,0)	ap2	21079100	DI524	30	2
AP3	00:00:10:10:20:12	N/A	(150,60,0)	ap3	21079100	DI524	30	3
AP4	00:00:10:10:20:13	N/A	(160,100,0)	ap4	21079100	DI524	30	6
AP5	00:00:10:10:20:14	N/A	(160,150,0)	ap5	21079100	DI524	30	4
STA1	00:00:10:18:00:02	192.168.110.13/24	(30,50,0)	N/A	21079100	N/A	25	N/A
STA2	00:00:10:18:00:03	192.168.110.14/24	(30,50,0)	N/A	21079100	N/A	25	N/A
STA3	00:00:10:18:00:04	192.168.110.15/24	(30,50,0)	N/A	21079100	N/A	25	N/A
STA4	00:00:10:18:00:05	192.168.110.16/24	(30,50,0)	N/A	21079100	N/A	25	N/A

Name	Start Location	End Location	Start Time-End Time	Moving Speed (min-max)
STA1	(30,50,0)	(140, 80, 0)	10s-20s	min_v=1, max_v=5
STA2	(30,50,0)	(100,50,0)	30s-60s	min_v=5, max_v=10
STA3	(30,50,0)	(170,75, 0)	25s-60s	min_v=2, max_v=7
STA4	(30,50,0)	(50,50,0)	10s-20s	min_v=2, max_v=7

On a closer look at task 1, there is a requirement of 5 wifi access points as shown in the floor plan of a new building which could be accessed by the users in concern. These 5 access points are needed to emulate the environment for which one needs to write the function in a python script. These 5 wifi access points can be installed efficiently using the Mininet tool (Gupta *et al.*, 2022). The UDPS network followed by the previously installed access points can be executed efficiently including all the network functions. To work with the server, the given configuration must work by developing mininet tools, access points, and service stations. The user in concern can develop a python script to initiate the deployment process (DeCusatis, Carranza & Delgado-Caceres, 2016)

## ii. Experiments

Observing the illustrated plan, one can note the location of the five major access points that are to be used for emulating purposes. It is also observed that these emulation purposes are solely

emulating 4 stations. Stations STA1, STA2, STA3, and STA4 are required to be masked as a Class C IP address. The APS that is required in this plan has to be connected with the use of physical links facilitating the linear topology (Pang *et al.*, 2020). To make sure that the operation is precisely fulfilled as well as attention is clear, a UDP connection must be present between STA2 and UDPS while the UDP server takes the job to connect the network between different networking devices. Below are the screenshots of Mininet Wi-Fi GUI:

- Prior Mobility:

- During Mobility:

- At the completion of the mobility:

3. Below is the screenshot of connection of access point after the completion of the mobility by stations:

Below is the screenshot of the access point connected upon completion of mobility by stations:

```

```

### iii. Evidence and Screenshots

According to task 1, the code is designed, and a snippet has been given for the same.

- The snapshot of the given code explains the significance of python software that has been applied abundantly for task 1 that helps to manage the wifi compatible device. In the given network architecture, there use of various access points and networking for functional applications.
- It is mandatory to have a station in a mobility state.
- For communication, project encryption is the major motivator.
- Wpa2 and the fail Mode are standalone (Muqaddas et al. 2016)
- The average jitter calculated is 65.45 milliseconds.

### iv. Analysis and discussion

One can handle the amount of data that can be transmitted from the system based on the networking structure. The packet loss is inversely proportional to bandwidth reduction. Thus, it can be said that packet loss is the result of jitter effects in an overall system implementation.

## **b. Task 2:**

### **i. Methodology**

In this assignment, one can understand from the floor plan of the building and emergency gathering car parking, it is a requirement of a minimum of 3 device mobility. The operator requires 4 Adhoc stations as well as a python script file is required for this to modify the required operation to what the plan desires (Hedges *et al.*, 2019). Initiation of ICMP stream is lying between the sta4ad < - - -> sta5ad, sta5ad < - - -> sta6ad and sta4ad < - - -> sta6ad.

### **ii. Experiments**

It has been proved that maintaining the connection that determines the configuration towards The Mininet Wifi python script is highly regarded and utilized. In the case of ICMP maintenance, one must use a stream to establish the connection between sta5adhoc and sta6adhoc. One must also perform managing experiments in UDP transmission which will help the user to understand jitter and packet loss.

### **iii. Evidence and Screenshots**

The network design of task 2 is demonstrated in the following screenshot.

- 1.

Name	IPv6	MAC	Position	Range	Antenna Height	Antenna Gain	Protocol	SSID	HT_CAP
sta4ad	fe65::21	00:00:10:20:15:06	175,175,0	40	1	5	olsr	adhocUH	HT40+

--- 10.0.0.7 ping statistics ---
7 packets transmitted, 3 received, 57% packet loss, time 6090ms
rtt min/avg/max/mdev = 2.059/108.565/215.620/87.186 ms
```

3.

- Below is the screenshot of successful ICMP Stream between sta7ad and sta8ad:

```
mininet-wifi> sta7adhoc ping sta8adhoc
bash: babeld: command not found
PING 10.0.0.9 (10.0.0.9) 56(84) bytes of data.
64 bytes from 10.0.0.9: icmp_seq=3 ttl=64 time=219 ms
64 bytes from 10.0.0.9: icmp_seq=6 ttl=64 time=107 ms
^C
--- 10.0.0.9 ping statistics ---
6 packets transmitted, 2 received, 66% packet loss, time 5082ms
rtt min/avg/max/mdev = 107.619/163.797/219.975/56.178 ms
```

- Below is the screenshot of successful ICMP Stream between sta8ad and sta9ad:

```
mininet-wifi> sta8adhoc ping sta9adhoc
PING 10.0.0.10 (10.0.0.10) 56(84) bytes of data.
64 bytes from 10.0.0.10: icmp_seq=3 ttl=64 time=220 ms
64 bytes from 10.0.0.10: icmp_seq=6 ttl=64 time=75.8 ms
^C
--- 10.0.0.10 ping statistics ---
6 packets transmitted, 2 received, 66% packet loss, time 5089ms
rtt min/avg/max/mdev = 75.875/148.063/220.251/72.188 ms
```

- Below is the screenshot of successful ICMP Stream between sta7ad and sta9ad:

```
mininet-wifi> sta7adhoc ping sta9adhoc
PING 10.0.0.10 (10.0.0.10) 56(84) bytes of data.
64 bytes from 10.0.0.10: icmp_seq=3 ttl=64 time=215 ms
64 bytes from 10.0.0.10: icmp_seq=6 ttl=64 time=108 ms
64 bytes from 10.0.0.10: icmp_seq=7 ttl=64 time=1.44 ms
^C
```

4.

a.

- Below is the screenshot of TCP transfer among server- sta6adhoc and client – sta5adhoc on port 1163:

The screenshot shows two terminal windows. The left window, titled "Node: sta5adhoc", displays the output of an iperf client command. The right window, titled "Node: sta6adhoc", displays the output of an iperf server command. Both windows show a successful connection and a transfer of 100 MBytes at a bandwidth of 6.25 Mbits/sec.

```

b.

- Below is the screenshot of Average Throughput graph of transfer data between server – sta6adhoc and client sta5adhoc on port 1163:

In the above TCP transfer, 100MB of data is transferred in 134.0 seconds.

So, average throughput of that transfer is: **6.26** Mbits/sec.

- Below is the screenshot of Average Throughput graph of transfer data between server – sta9adhoc and client sta8adhoc on port 1564:

In the above TCP transfer, 100MB of data is transferred in 157.3 seconds.

So, average throughput of that transfer is: **5.33Mbits/sec**.

The snapshots that have been attached, give an example of the system information that is required in the given adhoc stations.

- It is necessary to have speed, MAC address, IPv6 address, and username position for the given management.
- The calculated packet loss is found to be null.

#### **iv. Analysis and discussion**

- One can make sure that the level of the packet reaches the high target networking system as well as the ability of system management properly.
- The components used for this plan are Mininet, Adhoc networking, and WIFI networking (Castanheira, 2018)
- Two adhoc protocols define olsr, babel, and networking systems.
- Regular wireless networks cannot be inferior to that wireless adhoc networks.

### **c. Task3**

#### **i. Methodology**

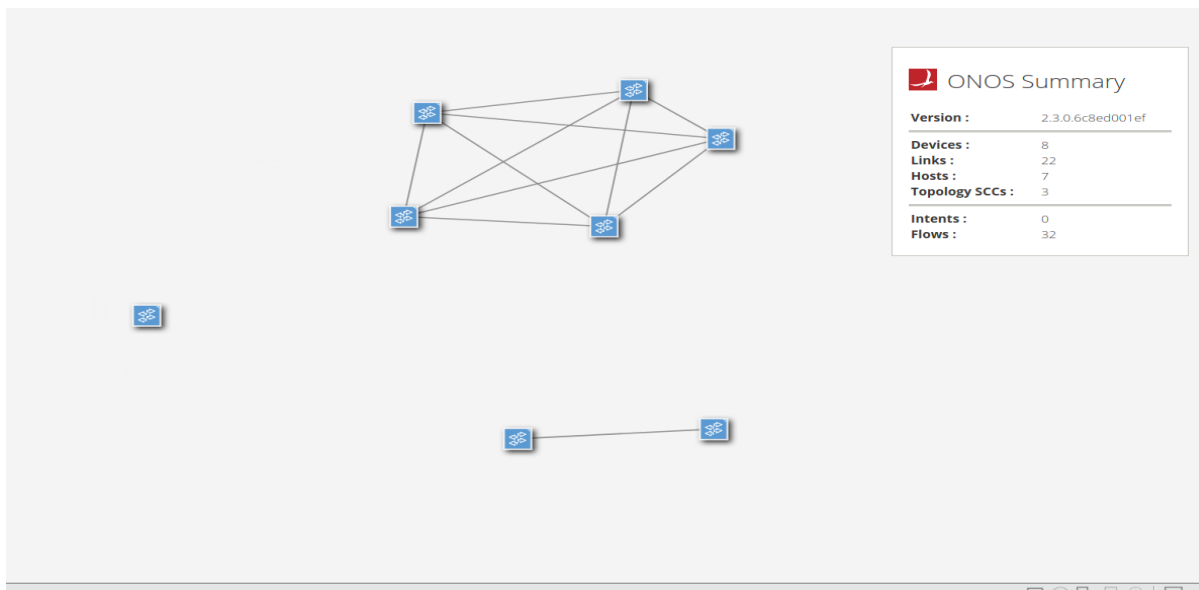

The system based on the university of Hertfordshire python scripture is used to emulate the environment. In between the server/UDP and host a UDP flow occurs which can be summed up to a total of 480. This should be used properly in the system management method so that the configuration command is dealt with with ease. In task 3, the ONOS controller can be applied (Bannour *et al.*, 2018). This methodology can control all the major operations for this task. According to the plan, two of the buildings and the server room should be connected where a separate VLAN and switches present in each building are examined thoroughly.

#### **ii. Experiments**

Objective of the situation can be maintained by the three major experiments such as focusing on the TCP communication to maintain coordination between the clients and server. Secondly, application of IPERF tool to ensure data transfer and traffic capture between clients and servers. Thirdly, application of Wireshark tools to ensure capture between the TCP traffic. There is the requirement of multicasting video system requirement to have design and management of operations (Arbettu et al. 2016). VLAN Functionality must be maintained to have access on each of channel. RDP connection and Wireshark packet capture must be the central focus of each of the operations.

#### **iii. Evidence and Screenshots**

- The below mentioned screen shot provide clear indication of TCP communication to maintain server control.

- Following are the screenshots for VLAN Functionality:
  - As we can see in the below screenshot that the hosts are not pinging with each other.

```
s7com1030@ubuntu:~/Downloads$ sudo mn --controller remote,ip=127.0.0.1 --custom Task3.py --topo mytopo
[sudo] password for s7com1030:

Welcome to the Module 7COM1076. Created for educational purposes for students of University of Hertfordshire. Module Leader Dr Tazeen Syed. Email Address : tazeen.syed@herts.ac.uk
or Practicals, Please contact Omesh Fernando ~ Email Address : w.k.fernando@herts.ac.uk
s7com1030@ubuntu:~$ onos localhost
Welcome to Open Network Operating System (ONOS)!

  ONOS

Documentation: wiki.onosproject.org
Tutorials:    tutorials.onosproject.org
Mailing lists: lists.onosproject.org

Some help out! Find out how at: contribute.onosproject.org

Hit '<tab>' for a list of available commands
Hit '[cmd] --help' for help on a specific command.
Hit '<ctrl-d>' or type 'logout' to exit ONOS session.

s7com1030@root > app activate org.onosproject.gui2
Activated org.onosproject.gui2
s7com1030@root > app activate org.onosproject.openflow
Activated org.onosproject.openflow
s7com1030@root > app activate org.onosproject.fwd
Activated org.onosproject.fwd
s7com1030@root > apps -a -s

```

Based on the scenario lecturer room of each of the building must be separated and connection is done through the ring or grid topology (Arbettu et al. 2016). Therefore, before implementing and networking structure, it is required to have the Ping Command to test the networking system and control.

#### Task: 4

1.

Name	IP Address	Room	MAC	VLAN
H1	192.168.111.17/24	Lecture Room A	00:00:10:20:18:10	400
H2	192.168.111.18/24	Lecture Room B	00:00:10:20:18:11	400
H3	192.168.111.19/24	Lecture Room C	00:00:10:20:18:12	400
H4	192.168.111.20/24	Lecture Room D	00:00:10:20:18:13	400
H5	192.168.111.21/24	Lecture Room E	00:00:10:20:18:14	400
H6	192.168.111.22/24	Lecture Room F	00:00:10:20:18:15	500
H7	192.168.111.23/24	Lecture Room G	00:00:10:20:18:16	500
Server	20.0.0.1/8	Server Room	00:00:10:20:18:17	N/A
UDP	40.0.0.1/8	Server Room	00:00:10:20:18:18	N/A

2. Below are the commands which are used to configure the route between the server – SERVER and the client – H1 :

On the server side write the following commands:

- echo 0 > /proc/sys/net/ipv4/icmp\_echo\_ignore\_broadcasts
- ip route add 192.168.111.0/24 dev SERVER-eth0
- ping 192.168.111.17

On the client side write the following commands:

- echo 0 > /proc/sys/net/ipv4/icmp\_echo\_ignore\_broadcasts
- ip route add 20.0.0.0/8 dev H1-eth0
- ping 20.0.0.1.

Below screenshot shows that the route between the server and the client configured successfully:

The screenshot shows two terminal windows side-by-side. The left window is titled "Node: SERVER" and the right window is titled "Node: H1".

**Node: SERVER terminal:**

```
root@ubuntu:~/Downloads# echo 0 > /proc/sys/net/ipv4/icmp_echo_ignore_broadcast
root@ubuntu:~/Downloads# ip route add 192.168.111.0/24 dev SERVER-eth0
root@ubuntu:~/Downloads# ping 192.168.111.17
PING 192.168.111.17 (192.168.111.17) 56(84) bytes of data:
64 bytes from 192.168.111.17: icmp_seq=1 ttl=64 time=9.04 ms
64 bytes from 192.168.111.17: icmp_seq=2 ttl=64 time=0.651 ms
64 bytes from 192.168.111.17: icmp_seq=3 ttl=64 time=0.098 ms
^C
--- 192.168.111.17 ping statistics ---
3 packets transmitted, 3 received, 0% packet loss, time 2021ms
rtt min/avg/max/mdev = 0.098/3.264/9.043/4.092 ms
root@ubuntu:~/Downloads#
```

**Node: H1 terminal:**

```
root@ubuntu:~/Downloads# echo 0 > /proc/sys/net/ipv4/icmp_echo_ignore_broadcast
root@ubuntu:~/Downloads# ip route add 20.0.0.0/8 dev H1-eth0
root@ubuntu:~/Downloads# ping 20.0.0.1
PING 20.0.0.1 (20.0.0.1) 56(84) bytes of data:
64 bytes from 20.0.0.1: icmp_seq=1 ttl=64 time=0.090 ms
64 bytes from 20.0.0.1: icmp_seq=2 ttl=64 time=0.091 ms
^C
--- 20.0.0.1 ping statistics ---
2 packets transmitted, 2 received, 0% packet loss, time 1014ms
rtt min/avg/max/mdev = 0.090/0.090/0.091/0.009 ms
root@ubuntu:~/Downloads#
```

3. Below is the screenshot of confirming the route between SERVER and client-H1 on port 2264:

The screenshot shows two terminal windows side-by-side. The left window is titled "Node: SERVER" and the right window is titled "Node: H1".

**Node: SERVER terminal:**

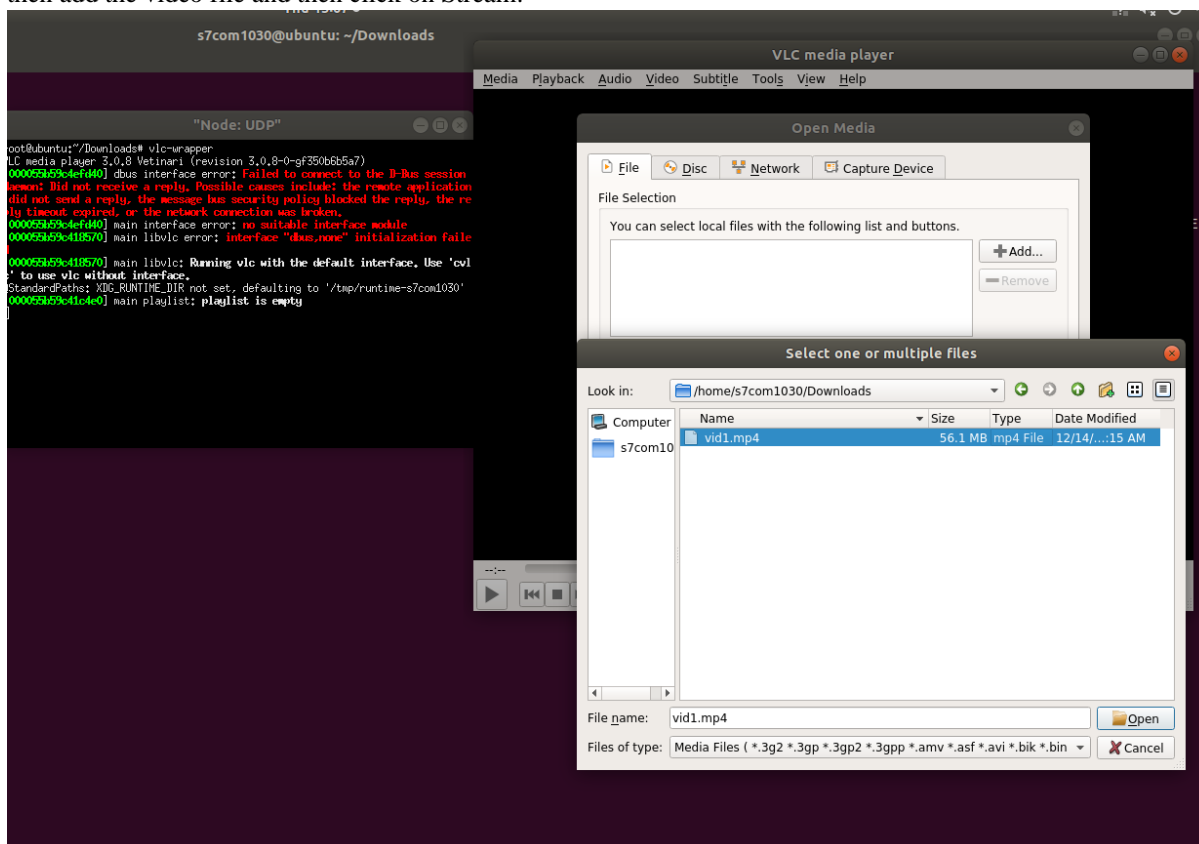

```
root@ubuntu:~/Downloads# iperf -s -u -p 2264 -t 480 -b 10M
Server listening on UDP port 2264
Receiving 1470 byte datagrams
UDP buffer size: 208 KByte (default)
[ 41] local 20.0.0.1 port 2264 connected with 192.168.111.17 port 60562
[ ID] Interval      Transfer    Bandwidth  Jitter  Lost/Total Datagrams
[ 41] 0.0-480.0 sec  600 MBytes  10.5 Mbits/sec  0.024 ms  0/427991 (0%)
[ 41] 0.00-479.99 sec  3 datagrams received out-of-order
root@ubuntu:~/Downloads#
```

**Node: H1 terminal:**

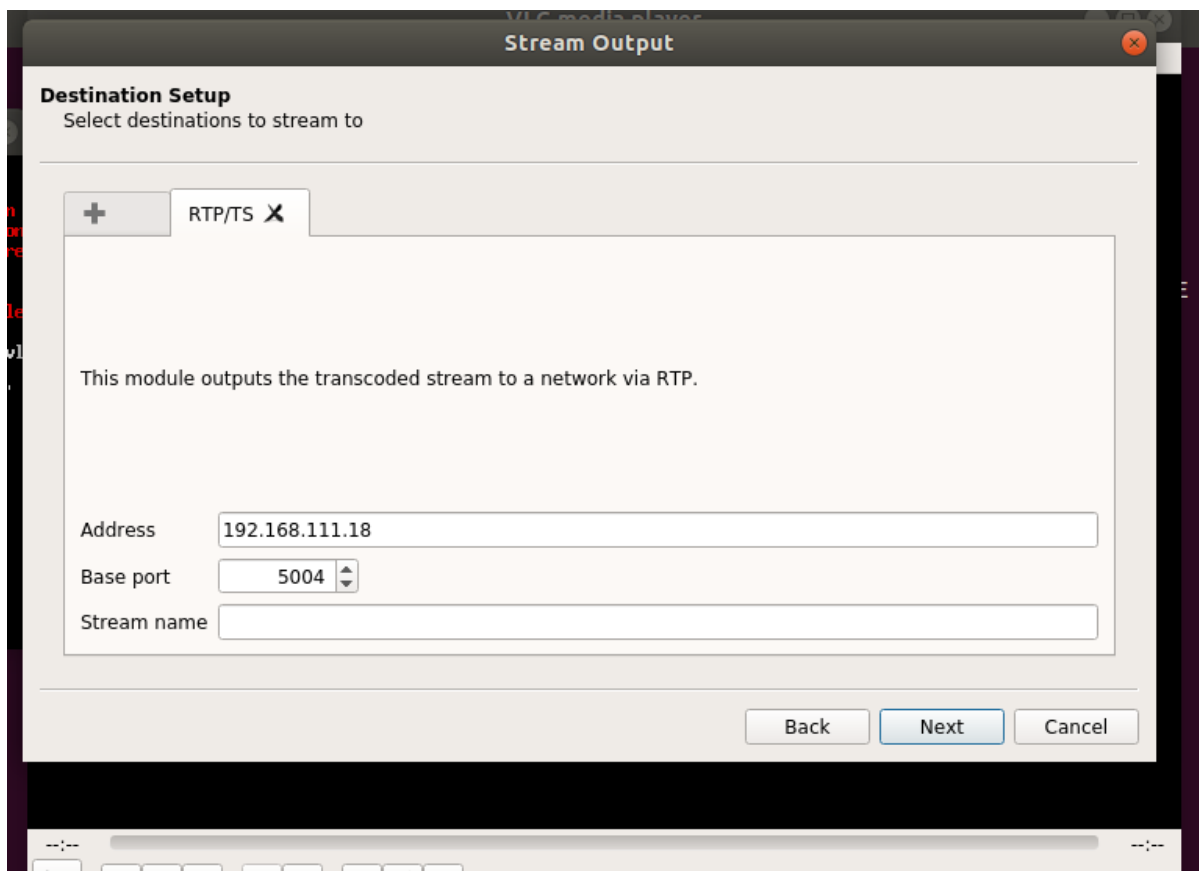

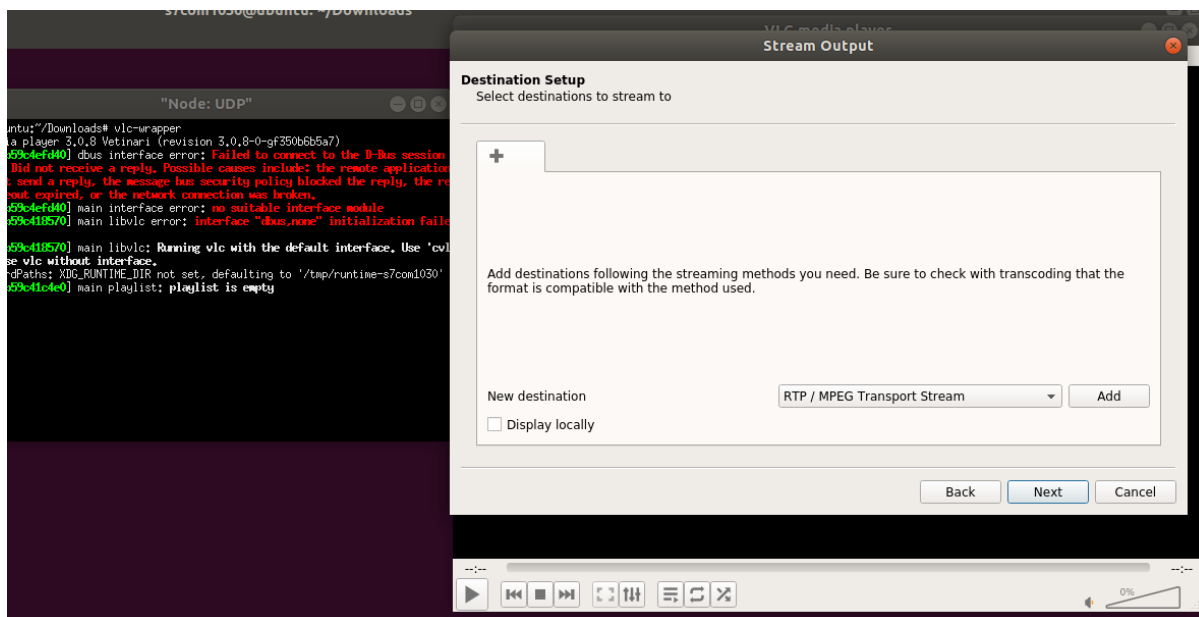

```
root@ubuntu:~/Downloads# iperf -c 20.0.0.1 -u -p 2264 -t 480 -b 10M
Client connecting to 20.0.0.1, UDP port 2264
Sending 1470 byte datagrams, IPG target: 1121.52 us (kalman adjust)
UDP buffer size: 208 KByte (default)
[ 41] local 192.168.111.17 port 60562 connected with 20.0.0.1 port 2264
[ ID] Interval      Transfer    Bandwidth
[ 41] 0.0-480.0 sec  600 MBytes  10.5 Mbits/sec
[ 41] Sent 427991 datagrams
[ 41] Server Report:
[ 41] 0.0-480.0 sec  600 MBytes  10.5 Mbits/sec  0.000 ms  0/427991 (0%)
[ 41] 0.00-479.99 sec  3 datagrams received out-of-order
root@ubuntu:~/Downloads#
```

4. Below is the screenshot of video streaming of the video on both Host and Servers VLC players:

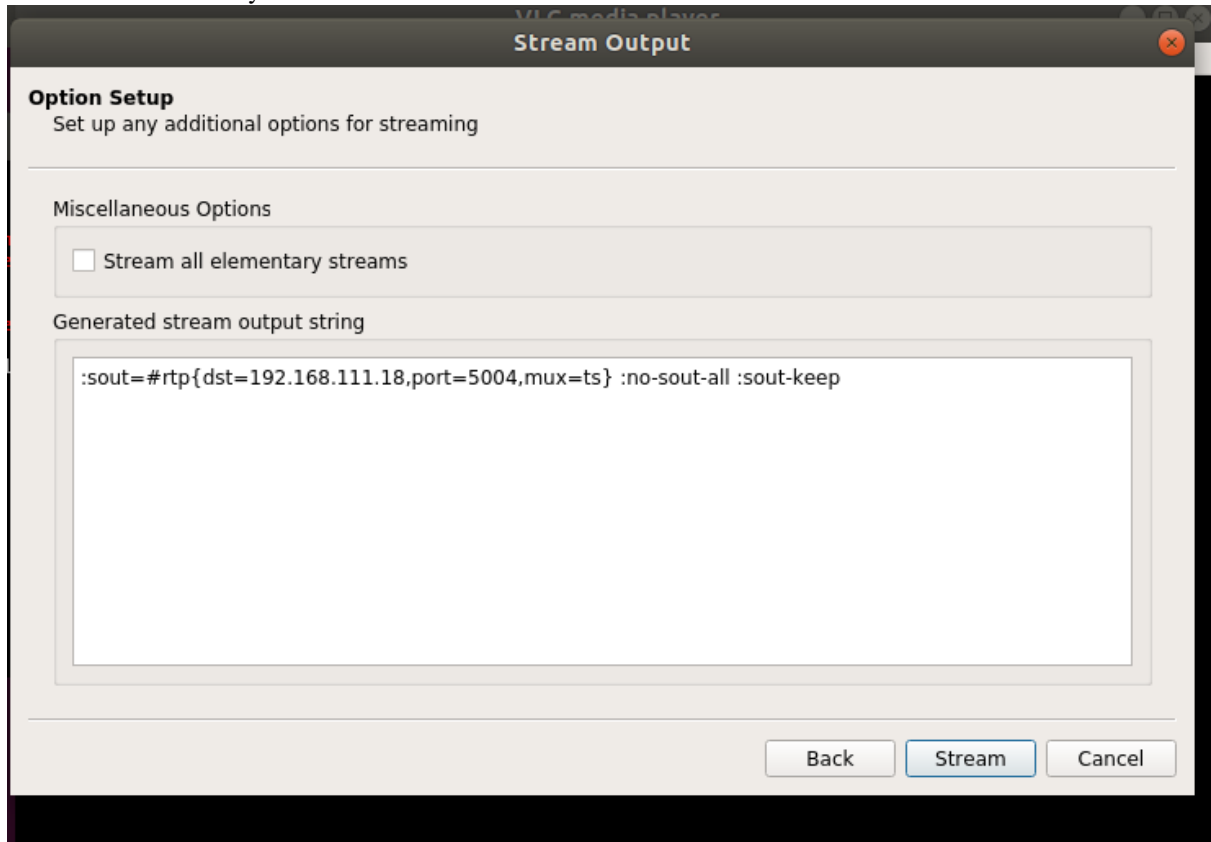

- First of all, on the server cli write the command **vlc-wrapper** to open the VLC media player and then in VLC media play go to Media and then select Stream option and in the Stream, option click on Add and then add the video file and then click on Stream.

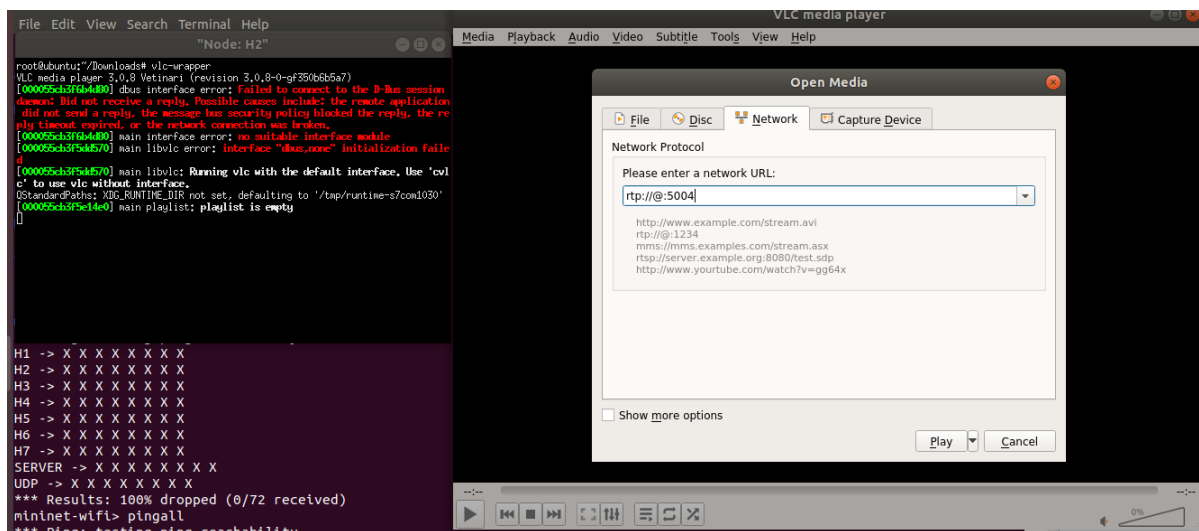

- Now in the Destination Setup, select the new destination as **RTP/MPEG Transport Stream** and then click on Add button.  
In the next window, write the IP address of the client on which we have to run the video and then click on Next.

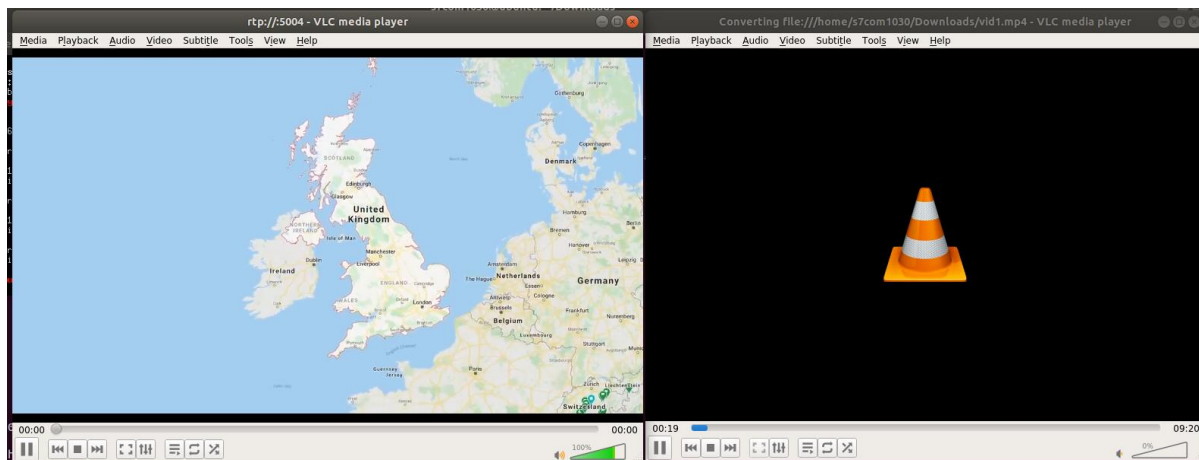

- Now click on stream by which we can stream the video in the network.

- Now write the command **vlc-wrapper** on the client cli and then in the VLC media player open the network stream from the media option and then write the network URL and then click on Play.

- As you can see our video file is running on the client vlc media player.

**The ping command** is the simplest and most common command for completing basic connectivity for testing. This process helps the moderator to display all the connectivity between all the nearest hosts to tell connects between each of the system.

#### **iv. Analysis and discussion**

Based on the above mentioned finding, it has been identified that significant delay in the trafficking can cause potential issue for networking management. The networking system must be well designed by the application of ping command to host communicates in realistic networking environment. The ping command work in the mininet by finding out the hosts. MAC address of the second can be controlled very significantly through the evaluation of the first host and pushes down a flow entry (Secci *et al.*, 2019). Creation of simple network of two hosts and one switch is the main focus of the system.

### **3. Conclusion:**

Thus, it can conclude that main focus of the wireless network is to supporting several servers for video streaming and other distributed applications. UDP connection network is the simplest way to have performance on the operation. Application of multicast streaming & SDN network is useful to establish communication. First step involve application of mininet. Secondly, setup of ad hoc stations is very effective for operation. Finally, utilizing the ONOS tool is the network trafficking in the server and client is very important.
